

## 1 Supplemental materials

**Figure S1.** Maturation functions for clearance (left), absorption rate constant ( $k_a$ , middle), and absorption mean transit time (MTT, right). Plotted are the percentage of mature values against post-menstrual age (for clearance) or post-natal age (for  $k_a$  and MTT). The blue line marks assumed gestational age at birth (9 months), while the red notches mark the ages of the study subjects.

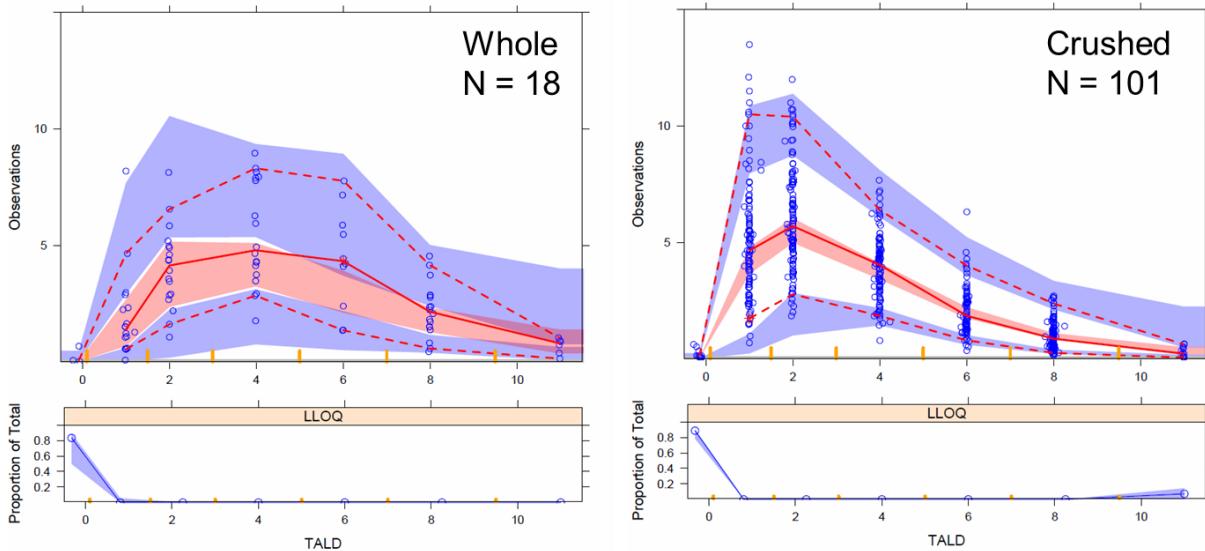

9

10

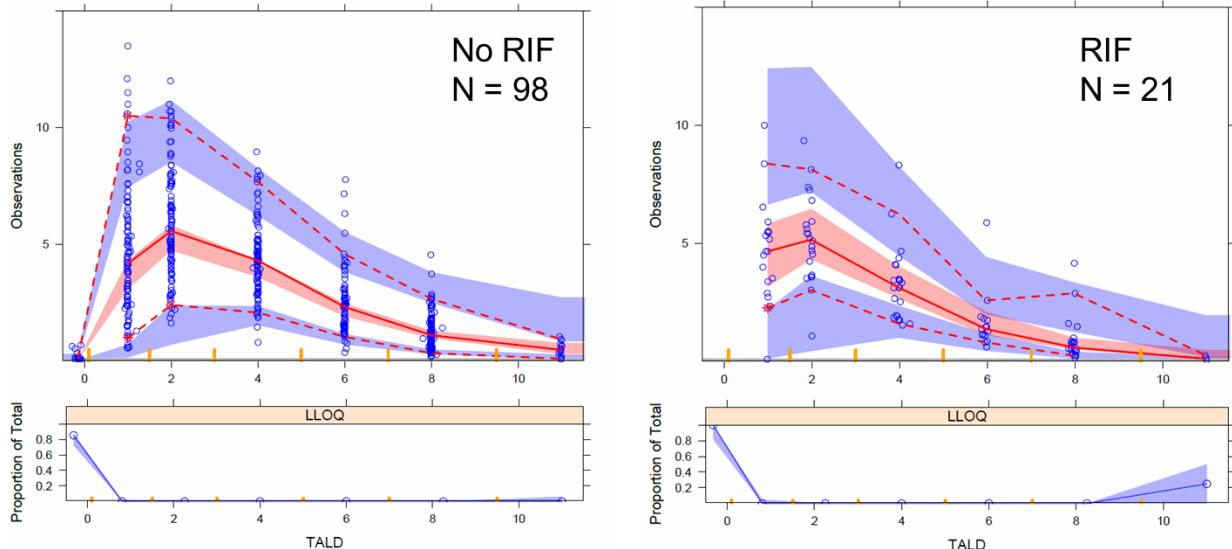

11 **Figure S2.** Visual predictive check (VPC) of ethionamide concentration versus time  
 12 after last dose (TALD), all observations on normal scale (left) and semi-logarithmic  
 13 scale (right).

14

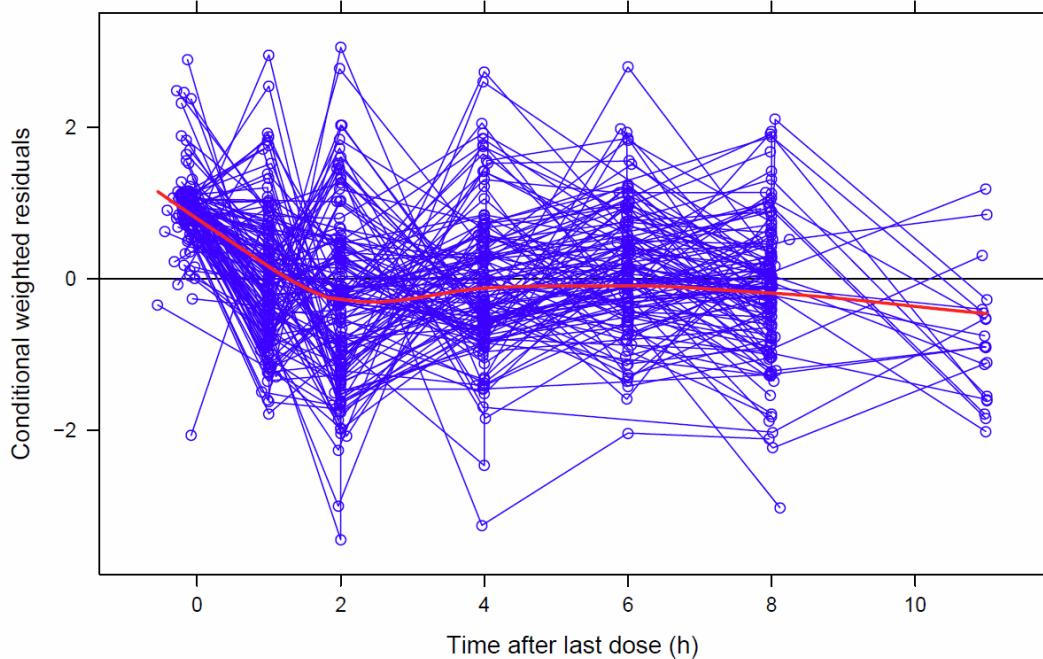

15

16 **Figure S3.** Visual predictive check (VPC) of ethionamide concentration versus time  
 17 after last dose (TALD), stratified on whole (left) or crushed tablet (right).

18  
19 **Figure S4.** Visual predictive check (VPC) of ethionamide concentration versus time  
20 after last dose (TALD), stratified on rifampicin co-administration.  
21  
22

23  
24 **Figure S5.** Conditional weighted residuals (CWRES) versus time after last dose. The  
25 red line is a smooth function.
